Next Generation Networks

INSE 7110 – Winter 2008
Value Added Services Engineering in Next Generation Networks
Week #3
Outline

1. Basics
2. Media Handling
3. Quality of Service (QoS)
Basics

- Definitions
- History
- Standards
Definitions …

Next generation networks
Loosely used to refer to:

- Third generation networks
  Currently being deployed mainly in Europe and Asia
  - Internet Telephony
  - 3G

Or

- Networks which will replace the third generation networks
  - Beyond 3G
  - 4G

Or both
  - 3G and Beyond 3G (3GB)
Definitions ...

Next generation networks

More formal definition (ITU-Definition – 3G focused definition):

- Packet based
- Use of multiple broadband technologies
- QoS Enabled
- Separation of service related functions and transport related functions (Not really new)
- Unrestricted access for users to networks and competing service providers (not really new)
- Generalized mobility (Not that new)
Definitions …

Next generation networks

A Use case (ITU-T)

Mobile tele-medecine
- Remote clinic with limited staff and WLAN connected via broadband to main hospital
- Multimedia conferencing between staff at remote clinic and experienced physicians at main hospital
  - Early examination report to main hospital
  - Information from medical report stored at main hospital sent to remote clinic
  - Vital health data sent from the ambulance to the main hospital
Definitions …

Key distinctive characteristics

1. Packet switching (instead of circuit switching in today’s 2G networks)

2. QoS enabled (unlike the Internet best effort)

3. Voice + data (unlike today’s 2G networks which focus on voice)

The main components

1. Signaling
2. Media handling
3. Quality of service
4. Value added services
A brief history …

Milestones

– Late 70s:
  • First two party voice calls over Internet (Network Voice Protocol (NVP - RFC 741 - November 1977)

– 80s:
  • Emergence of proprietary systems for Internet Telephony

– 90s:
  • Emergence of standards (e.g. SIP, H.323, Megaco/H.248)

– Early 00s:
  • Backing by telcos (e.g. 3GPP specifications)
  • Backing by other new players (e.g. cable industry)
The standards: The dedicated bodies ...

3GPP (Third Generation Partnership Project - 1)
- Established in 1998 as collaboration agreement between several standards bodies (e.g. ETSI, CCSA, ARIB, T1)
- Aim at establishing standards globally applicable to third generation mobile networks based evolved GSM core networks

3GPP2 (Third Generation Partnership Project – 2)
- Established in 1998 as collaboration agreement between several standards bodies (e.g. CCSA, ARIB, TIA)
- Aim at establishing standards globally applicable to third generation mobile networks based evolved IS-95 core networks

Packetcable (Formerly known as soft switch consortium)
- Established in 1997
- Aim at establishing standards for delivering real time multimedia services over two ways cable packet networks
The standards: The other bodies

Internet Engineering Task Force (IETF)
- Focus on protocols

International Telecommunications Union (ITU)
- Focus on telephony networks
  ITU-T
  ITU-R
The standards: Protocols at the network level ...
Media handling …

1. Introduction
2. Media transportation
3. The programmer’s viewpoint
Introduction …

Media handling …
  - Transportation …
  - Conversion
  - Mixing

Related concepts
  - Media stream
    - Simple streams (e.g. voice)
    - Multiplexed streams (e.g. voice + video)
    - Ports or transport selectors
  - Content type (i.e. format)
    - Examples: MPEG

Key issue: Real time delivery and processing
Media transportation …

Two complementary protocols
- Actual transportation:
  Real-time Transport Protocol (RTP)
- Control of transportation:
  RTP Control Protocol (RTCP)
Media transportation ...

Main characteristics

**RTP:**
- No provision for Quality of service
- No guarantee for out of sequence delivery
- Typically runs on top of UDP but may run on top of other protocols

**RTCP:**
- Help in providing control
Media transportation ...

Two party audio call
- Information required
  Ports

Two party audio and video calls
- Information required
  Ports
Media transportation …

Multicast audio conference on Internet
- Information required
  Multicast address
  Ports

Multicast audio / video conference on Internet
- Information distributed to the participants
  Multicast address
  Ports
RTP concepts …

Session
- Logical association between parties communicating with RTP
  - Identified for each participant by:
    - IP address (may be common for all participants)
    - RTP port
    - RTCP port

End system
- Application that generates the content to be sent and/or
- receive the content to be consumed
- Examples: IP phones, PCs, microphones …
RTP concepts …

Mixers / translators
- Intermediate systems
- Connect 2 or more transport level clouds
  - End systems
  - Mixers / translators
- Use cases
  - Centralized conference bridges
  - Heterogeneous conferences
    - Low speed connection
    - High speed connection
    - Different encoding schemes
  - Some participants behind firewalls
RTP concepts …

**Synchronization source (SSRC)**
- Grouping of data sources for playing back purpose (e.g. voice vs. video)
- An end system can act as several synchronization sources (e.g. IP phone with video capabilities)
- Translators forward RTP packets with their synchronization source intact

**Contributing source (CSRC)**
- A source of a stream of RTP packets that has contributed to the combined stream produced by an RTP mixer
- Mixers insert the list of contributing sources in the packets they generate
RTP packets: Structure

Header
- Fixed
- Maybe followed by one header extension if extension bit is set

Body
- Contains the actual data
RTP header – Selected fields

Version:
Extension:
Payload type: Format of payload (e.g. encoding scheme)
  Profile for audio and video conference
  Other types
Sequence number
Time stamp
CSRC lists
RTCP concepts ...

Monitor:
- Application that receives RTCP packets sent by participants in an RTP session

Reports
- Reception quality feedback
- Sent by RTP packets receivers (which may also be senders)

Permanent RTP source identifier (CNAME)
- For keeping track of each participant
RTCP packets ...

Packet types
  Simple
  Compound

Examples of packets
  Sender reports
  Receiver reports
  Bye
RTCP packets ...

Receiver report (Selected fields)
  Version
  Time stamp
  Sender’s packet count
  Reception report blocks
Programmers viewpoint …

Standard APIs
- Ease application development by offering “high level” programmatic interfaces to protocols
- Enable the development of portable applications
- An example for media handling
  - Java Media Framework (JMF)
Programmers viewpoint ...

JMF key design goals

- Be easy to use
- Support capturing media data
- Enable the development of media streaming and conferencing applications in Java
- Enable customized solutions based on the existing API (e.g. higher level API)
- Provide access to raw media data
- Enable the development of customized downloadable de-multiplexers, mixers/translators and so on ...
Programmers viewpoint ...

JMF RTP/RTCP APIs key design goals

- Be easy to use
- Support media data reception and transmission using RTP/RTCP
- Enable the development of media streaming and conferencing applications in Java
Programmers viewpoint ...

JMF high level architecture

Quality of Services

1. Introduction
2. Early attempts
3. Differentiated services
Introduction …

1. Circuit switched telephony
   - Reserved path
   - Single grade of service (The highest)

2. Classical Internet
   - No reserved path
   - Single grade of service (i.e. best effort)
   - Highly unsuitable for telephony
Early attempts ...

IP Precedence and Type of Service

Type of service octet
  Precedence: Indicate the priority
  • O: lowest
  • 7: highest
Type of service
  • Low delay
  • High throughput
  • And others

Never got widely deployed: only anecdotal, ad hoc and experimental implementations
Early attempts: Integrated Service Architecture - IntServ …

Provide end to end QoS guarantees

Service classes

1. Guaranteed service
   - Hard guarantee on delay and bandwidth
   - Parameters provided by application
     - Peak rate
     - Packet size
     - Burst size

2. Controlled load
   - Softer version of guaranteed service
   - Guarantee that the QoS is equivalent to what it would have been if the network is not overloaded
   - May not meet some of the hard requirements (e.g. delay)
Integrated Service Architecture - IntServ …

Requirements on each router in the path:

1. Policing
2. Admission control
3. Classification
4. Queuing and scheduling
Resource Reservation Protocol - RSVP …

Soft state signaling protocol used in InServ for unidirectional resource reservation

Rely on two messages:

PATH
- Propagated from sender to receiver

RESV
- Propagated in the opposite direction
Integrated Services ... 

Disadvantages

- Require major new software and firmware in routers
- Major overhead due to flows management
  - Flows are quite similar to telephone calls
    - Set up
    - Tear down
Differentiated services - DiffServ …

Aim at addressing IntServ drawbacks by focusing on traffic aggregates instead of individual flows:

Scalability
- No need for router to maintain flow states
- No for refreshment messages due soft-state

Lack of general applicability
- Work even if every router in the path does not support it

No need for applications to support new APIs
Differentiated services - DiffServ …

Fundamental principle: A code point – Differentiated service code point (DSCP) to tell routers how to treat a packet relatively to other packets

Per hop behaviour (PHB)
- Default
- Expedited forwarding
- Assured forwarding

Routers use PHB to drop/ prioritize packets on their output queue
Differentiated services - DiffServ …

The two approaches:

**Absolute service differentiation**
- Try to meet IntServ goals, but:
  - Without per-flow state
  - With static / semi-static resource reservation

**Relative service differentiation**
- Lower level of ambition
- Just ensure that relative priorities are respected
