## INSE 6230: Assignment 2 - Solution - Winter 2018

(0\% of final grade)

1. A project in progress has the following characteristics at the present time: $\mathrm{SPI}=1.35$, CPI=0.7, BAC $=\$ 6,400,000$, and $\mathrm{EAC}(\mathrm{t}=$ now $)=\$ 7,000,000$. Calculate AC, PV, EV, ETC and VAC under the 2 following situations:
a. The project continues under the conditions as originally planned.
b. We expect further problems.
a) $\mathrm{EAC}=7,000,000 \mathrm{BAC}=6,400,000 \mathrm{CPI}=0.7 \rightarrow \mathrm{EV}=0.7 \mathrm{AC}$
$\mathrm{EAC}=\mathrm{AC}+(\mathrm{BAC}-\mathrm{EV})$
$7,000,000=\mathrm{AC}+(6,400,000-0.7 \mathrm{AC})$
$\mathrm{AC}=2,000,000 \rightarrow \mathrm{EV}=1,400,000$
$\mathrm{SPI}=1.35 \rightarrow \mathrm{PV}=\mathrm{EV} / 1.35 \rightarrow \mathrm{PV}=1,037,037.04$
$\mathrm{ETC}=\mathrm{EAC}-\mathrm{AC}=5,000,000$
$\mathrm{VAC}=\mathrm{BAC}-\mathrm{EAC}=-600,000$
b) $\mathrm{EAC}=7,000,000 \mathrm{BAC}=6,400,000 \mathrm{CPI}=0.7 \rightarrow \mathrm{EV}=0.7 \mathrm{AC}$
$\mathrm{EAC}=\mathrm{AC}+(\mathrm{BAC}-\mathrm{EV}) /(\mathrm{CPI} * \mathrm{SPI})$
$7,000,000=\mathrm{AC}+(6,400,000-0.7 \mathrm{AC}) /(0.7 * 1.35)$
$\mathrm{AC}=877,551 \rightarrow \mathrm{EV}=614,285$
$\mathrm{SPI}=1.35 \rightarrow \mathrm{PV}=\mathrm{EV} / 1.35 \rightarrow \mathrm{PV}=455,026$
$\mathrm{ETC}=\mathrm{EAC}-\mathrm{AC}=6,122,449$
$\mathrm{VAC}=\mathrm{BAC}-\mathrm{EAC}=-600,000$
2. 

The Company should consult an expert on project \# 4 and if he recommends the project, then the company should invest on it. While if he doesn't recommend project \# 4, then the company shall invest in project \# 2 as it leads to the best EMV in this scenario, (where the expert doesn't recommend project \# 4).
3. A contractor has agreed to perform a work for a buyer, but the details of the contract are still not finalized. The contractor has been given a choice to select between Fixed Price Incentive (FPI) contract and Cost plus Incentive Fee (CPIF) contract. The following has been determined for both of the types: target cost $=\$ 500,000$; target fee $=\$ 50,000$; and sharing ratio of $70 / 30$. Moreover, for the FPI contract ceiling price would be $\$ 600,000$, and for the CPIF contract minimum fee would be $\$ 30,000$ and maximum fee $\$ 60,000$. Calculate the contractor's reimbursement and the contractor's profit for the following three possibilities of the actual cost of performing the work:
a. $\$ 450,000$
b. $\$ 560,000$
c. $\$ 590,000$

Which of the contract types should the contractor select?

## For FPI:

Target Cost=500.000\$
Target $\mathrm{Fee}=50.000 \$$
Sharing Ratio $=70 / 30$
Ceiling Price $=600.000 \$$

## For CPIF:

Target Cost=500.000\$
Target Fee $=50.000 \$$
Sharing Ratio $=70 / 30$
Minimum \& Maximum Fee $=30.000 \$ \& 60.000 \$$

## CPIF:

a. $\mathrm{AC}=450 \mathrm{~K}$

Incentive fee $=$ fixed fee + seller's share $($ target cost-actual cost $)=50 \mathrm{k}+(500 \mathrm{k}-450 \mathrm{k}) * 0.3=$ 65 k Seller's profit $=60 \mathrm{k}$
Seller's reimbursement: actual cost+ adjusted incentive fee $=450 \mathrm{k}+60 \mathrm{k}=510 \mathrm{k}$
b. $\mathrm{AC}=560 \mathrm{~K}$

Incentive fee: fixed fee + seller's share $($ target cost - actual cost $)=50 \mathrm{k}+(500 \mathrm{k}-560 \mathrm{k}) * 0.3=$ 32k
Seller's profit $=$ incentive fee adjusted to 32 k
Seller's reimbursement: actual cost +inn fee $=560 \mathrm{k}+32 \mathrm{k}=592 \mathrm{k}$
c. $\mathrm{AC}=590 \mathrm{k}$

Incentive fee: fixed fee + seller's share (target cost - actual cost) $=50 \mathrm{k}+(500 \mathrm{k}-590 \mathrm{k}) * 0.3=23 \mathrm{k}$ Seller's profit = incentive fee adjusted to 30 k
Seller's reimbursement: actual cost + incentive fee $=590 \mathrm{k}+30 \mathrm{k}=620 \mathrm{k}$

## FPI:

$$
\text { PTA }=\frac{\text { ceiling price-target price }}{\text { buyer's share }}+\text { target cost }=\frac{600 k-(500 k+50 k)}{0.7}+500 k=571,428
$$

a. $\mathrm{AC}=450 \mathrm{k}<500 \mathrm{k}$ Cost underrun

Seller's reimbursement: target cost ( $100 \%$ )
$=500 \mathrm{k}$ Fixed fee $(100 \%)=50 \mathrm{k}$
MINUS: $($ Target cost- actual cost) $*(70 \%)=(500 \mathrm{k}-450 \mathrm{k}) * 0.70=35 \mathrm{k}$
The buyer pays: Target Cost+ Fixed Fee- Buyer's Share Ratio*(Target Cost- Actual
Cost $)=500 \mathrm{k}+50 \mathrm{k}+70 \%(500 \mathrm{k}-450 \mathrm{k})=500 \mathrm{k}+50 \mathrm{k}-35 \mathrm{k}=515 \mathrm{k}$
Seller's profit $=50 \mathrm{k}+30 \%(500 \mathrm{k}-450 \mathrm{k})=50 \mathrm{k}+15 \mathrm{k}=65 \mathrm{k}$
b. $\mathrm{AC}=560 \mathrm{k}<$ PTA Cost overrun

Seller's reimbursement: target cost $(100 \%)=$
500k Fixed fee ( $100 \%$ ) = 50k
$($ Actual cost - Target cost $) *(70 \%)=(560 \mathrm{k}-500 \mathrm{k}) * 0.70=$
42 k The buyer pays: $500 \mathrm{k}+50 \mathrm{k}+42 \mathrm{k}=592 \mathrm{k}$
Seller's profit: fixed fee - seller's share of the overrun $=50 \mathrm{k}-(560 \mathrm{k}-500 \mathrm{k})^{*} 0.3=32 \mathrm{k}$
c. $\mathrm{AC}=590 \mathrm{k}>$ PTA Cost overrun

Seller's reimbursement: target cost (100\%)
$=500 \mathrm{k}$ Fixed fee $(100 \%)=50 \mathrm{k}$
$($ PTA- target cost $) *(30 \%)=(571,428 \mathrm{k}-500 \mathrm{k}) * 0.70=50 \mathrm{k}$
The buyer pays: $500 \mathrm{k}+50 \mathrm{k}+50 \mathrm{k}=600 \mathrm{k}$
Seller's profit: fixed fee - seller's share of the overrun $=50 \mathrm{k}-(571,428 \mathrm{k}-500 \mathrm{k}) * 0.3-(590 \mathrm{k}-$ $571,428)=10 \mathrm{k}$

If cost under run is expected FPI is better with no profit adjustment.
If cost overrun bellow PTA is expected then both FPI and CPIF have the same profit.
If larger cost overrun, above PTA is expected, CPIF is the choice.

Table of profit:

| Actual cost | FPI | CPIF |
| :---: | :---: | :---: |
| a | 65 k | 60 k |
| b | 32 k | 32 k |
| c | 10 k | 30 k |
