Q1

a) $F1 = AB + C, F2 = A'C' + B'C'$

$F1 \cdot F2 = (AB + C)(A'C' + B'C') = 0$

$F1 + F2 = AB + C + A'C' + B'C'$
 $AB + (C + A')(C + C') + B'C'$
 $AB + C + A' + B'C'$
 $(A' + A)(A' + B) + (C + B')(C + C')$
 $A' + B + C + B'$
 1

b)
 $F = ABC' + BC'D' + AC'D + ABC + BCD' + ACD'$
 $F = AB(C' + C) + BD'(C' + C) + AC'D + ACD'$
 $F = AB + BD' + AC'D + ACD'$

c) $f = AB + AC' + BC$
 Apply consensus $f = AC' + BC$

i) NOR-NOR

$f' = (A' + B')(A' + C)(B' + C')$
 $f' = (A' + A'B' + A'C + B'C)(B' + C')$
 $f' = (A'B' + A'B'C + B'C + A'C' + A'B'C')$
 $f' = A'B' + B'C + A'C'$

$\therefore f = (A'B' + B'C + A'C)'$
 $f = [(C + C') + (B + C') + (A + C)]'$ (consensus)

	C/AB	0	1	11	10
	0	0	0	1	1
	1	0	1	1	0

 $f = (A'B' + B'C + A'C)'$

$$C_{out} = BC_{in} + AC_{in} + AB$$

$$= AB + C_{in}(A \oplus B)$$

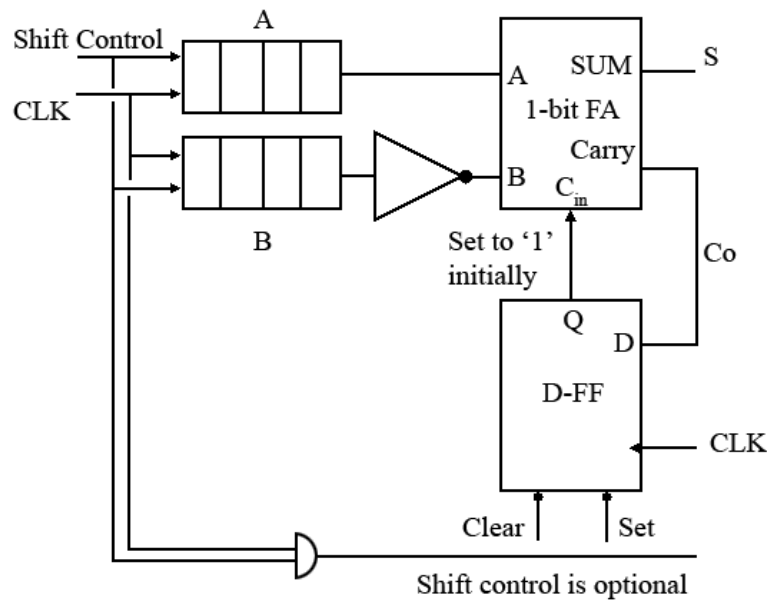

OR

Q3

b)

Subtraction can be done using the addition of two operands when one of the operands is in 2's complement form. 2's complement of an operand can be obtained by inverting all the bits and adding a 1 to the operand. In a full adder, the addition of 1 to the inverted bits can be done by setting the input carry to 1. For a serial adder, the input carry should be 'set' to 1 only at the first clock cycle.

Q4

a)

b)

$$F = ABC\bar{C} + B\bar{C}\bar{D} + A\bar{C}D + ABC + B\bar{C}\bar{D} + A\bar{C}D$$

d)

To calculate the delay, we consider the internal structure of the 4-to-1 MUX:

So for the above circuit implementation with MUX, the number of gates is:

From A to F = 3

From B to F = 3

From C to F = 3

From D to F = 3

So the worst case delay = 3 gate delays = 3d.
