Chapter 2 Basic Concepts of Probability Theory

ENCS6161 - Probability and Stochastic Processes Concordia University

Specifying Random Experiments

- Examples of random experiments: tossing a coin, rolling a dice, the lifetime of a harddisk.
- Sample space: the set of all possible outcomes of a random experiment.
- \bullet Sample point: an element of the sample space S

• Examples:
$$S = \{H, T\}$$

 $S = \{1, 2, 3, 4, 5, 6\}$
 $S = \{t|1 < t < 10\}$

• Event: a subset of a sample space $A \subseteq S$

$$A = \{H\}$$
$$A = \{2, 4, 6\}$$
$$A = \emptyset$$

ENCS6161 - p.1/16

The Axioms of Probability

- A probability measure is a set function $P(\cdot)$ that satisfies the following axioms.
 - **1.** $P(A) \ge 0$
 - **2.** P(S) = 1
 - **3.** If $A \cap B = \emptyset$, then $P(A \cup B) = P(A) + P(B)$
 - 4. If A_1, A_2, \cdots are events s.t $A_i \cap A_j = \emptyset$ for all $i \neq j$ then $P \cup_{k=1}^{1} A_k = \bigcap_{k=1}^{1} P(A_k)$
- Corollary 1: $P(A^{c}) = 1 P(A)$
- Corollary 2: $P(A) \leq 1 \quad \forall A$
- Corollary 3: $P(\emptyset) = 0$

ENCS6161 - p.2/16

The Axioms of Probability

- Corollary 4: If $A_1 \cdots A_n$ are mutually exclusive, i.e. $A_i \cap A_j = \emptyset$, $\forall i \neq j$ then $P(\bigcup_{k=1}^n A_k) = \bigcap_{k=1}^n P(A_k)$
- Corollary 5: $P(A \cup B) = P(A) + P(B) P(A \cap B)$

Union bound: $P(A \cup B) \leq P(A) + P(B)$

ENCS6161 - p.3/16

Counting Sample Points

Permutation: n distinct objects, how many ways can we arrange them?

 $n \cdot (n-1) \cdot (n-2) \cdots 2 \cdot 1 = n!$

• Selection with order: select k objects from $n \ge k$ objects

$$n \cdot (n-1) \cdots (n-k+1) = \frac{n!}{(n-k)!} = {}_{\mathbf{n}} P_{\mathbf{k}}$$

• Combination (selection *without* order): select k objects from $n \ge k$ objects

$$C_{\mathbf{k}}^{\mathbf{n}} = \frac{n!}{(n-k)!k!} = -\frac{n}{k}$$

ENCS6161 - p.4/16

Counting Sample Points

- Example: choose a president and a treasurer from 50 students
 - 1. no restrictions
 - 2. A will serve only if he is president
 - 3. B & C will serve together or not at all
 - 4. D & E will not serve together

ENCS6161 - p.5/16

Conditional Probability

The conditional prob. of A given B has occurred is defined by :

$$P(A|B) = \frac{P(A \cap B)}{P(B)}, \quad P(B) > 0$$

Similarly,

$$P(B|A) = \frac{P(A \cap B)}{P(A)}, \quad P(A) > 0$$

So

$$P(A \cap B) = P(B)P(A|B) = P(A)P(B|A)$$

ENCS6161 – p.6/16

- If $B_1 \cdots B_n$ are mutually exclusive and $\cup B_i = S$, we call these sets a partition of *S*.
- Theorem of total probability For any event A, if B_1, \dots, B_n is a partition of S,

$$P(A) = P(A \cap B_1) + P(A \cap B_2) + \dots + P(A \cap B_n)$$

= P(A|B_1)P(B_1) + P(A|B_2)P(B_2) + \dots + P(A|B_n)P(B_n)

• <u>Bayes' Rule</u> Let B_1, \dots, B_n be a partition of S, and $P(A) \ge 0$, then $P(B_j | A) = \frac{P(A \cap B_j)}{P(A)} = \Pr \frac{P(A | B_j) P(B_j)}{\prod_{k=1}^{n} P(A | B_k) P(B_k)}$

ENCS6161 - p.7/16

• Example: binary communication system

Y P(X = 0) = PP(X = 1) = 1 - P

- **1.** Find P(Y = 0)
- **2.** Find P(X = 0 | Y = 0) and P(X = 1 | Y = 0)

ENCS6161 – p.8/16

• Solution: let A be event Y = 0, B_0 be X = 0, B_1 be X = 1 $P(Y = 0) = P(A) = P(A|B_0)P(B_0) + P(A|B_1)P(B_1)$ $= (1 - \varepsilon)P + \varepsilon(1 - P)$

$$P(X = 0|Y = 0) = P(B_0|A) = \frac{P(A \cap B_0)}{P(A)}$$
$$= \frac{P(A|B_1)P(B_1)}{P(A)} = \frac{(1-\varepsilon)P}{(1-\varepsilon)P+\varepsilon(1-P)}$$

Similarly:

$$P(X = 1 | Y = 0) = \frac{\varepsilon(1 - P)}{(1 - \varepsilon)P + \varepsilon(1 - P)}$$

ENCS6161 - p.9/16

• If P(X = 0 | Y = 0) > P(X = 1 | Y = 0), we decide X = 0, i.e., if

 $(1-\varepsilon)P > \varepsilon(1-P) \quad \Rightarrow \quad P > \varepsilon,$

we decide X = 0.

- Similarly, if $P < \varepsilon$, we decide X = 1.
- A special case: if P = 0.5 and $\varepsilon < 0.5$ then

 $Y = 0 \Rightarrow$ we decide X = 0 $Y = 1 \Rightarrow$ we decide X = 1

ENCS6161 - p.10/16

Example: 2% of people have on type of blood disease. If a person has the disease and take a blood test, with 96% probability, the result is positive and with 4% probability, the result is negtive. If a person without the disease takes a blood test, then 94% negative and 6% positive. Find

P(have disease|positive)

ENCS6161 - p.11/16

Solution: Let

D: a person has the disease D^{0} . no disease

B: blood test positive B^0 . blood test negative

Then P(D) = 2% and

 $P(B|D) = 0.96 \quad P(B^{0}|D) = 0.04$

$$P(B|D^{0}) = 0.06 \quad P(B^{0}|D^{0}) = 0.94$$

Apply Bayes Rule:

P(D|B) = 0.246 = 24.6%

ENCS6161 - p.12/16

• We can also use tree diagram.

ENCS6161 - p.13/16

• How to find P(D|BB)?

$$P(D|BB) = \frac{P(D \cap BB)}{P(BB)}$$

=
$$\frac{0.02 * 0.96 * 0.96}{0.02 * 0.96 * 0.96 + 0.98 * 0.06 * 0.06}$$

=
$$83.9\%$$

ENCS6161 - p.14/16

Independence of Events

• A and B are independent iff

$$P(A \cap B) = P(A)P(B)$$

• If A and B are independent

$$P(A|B) = \frac{P(A \cap B)}{P(B)}$$
$$= \frac{P(A)P(B)}{P(B)}$$
$$= P(A)$$

Similarly

$$P(B|A) = P(B)$$

ENCS6161 - p.15/16

Independence of Events

• Events A_1, A_2, \cdots, A_n are independent if

$$P(A_{\mathbf{i}_1} \cap A_{\mathbf{i}_2} \cdots \cap A_{\mathbf{i}_k}) = P(A_{\mathbf{i}_1})P(A_{\mathbf{i}_2}) \cdots P(A_{\mathbf{i}_k})$$

where $1 \le i_1 < i_2 \cdots < i_k \le n$

- A special case $P(A_1 \cap \cdots \cap A_n) = {\mathsf{Q}_n \atop i=1} P(A_n)$
- In general if events are not necessarily independent

$$P(A_{1} \cap A_{2} \cdots \cap A_{n}) = P(A_{1})P(A_{2}|A_{1})P(A_{3}|A_{1} \cap A_{2}) \cdots$$
$$\cdots P(A_{n}|A_{1} \cap \cdots \cap A_{n-1})$$

ENCS6161 - p.16/16
