OUTLINE

1

Theoretical Background & Simplifications

2

Calculated Results

3

Conclusions

1 **Theoretical Background & Simplifications**

Background: Simplifications

Background: Simplifications

**Simplifications:**

- 1. Single droplet**
($\Phi 16.65 \mu\text{m}$, 500m/s)
- 2. Linear and rectangle wave**
- 3. Incident stress = 1 unit**
- 4. Incident time range = $100t_0$**
($t_0 = 3.3\text{E-}10 \text{ s}$)
- 5. 100 pulses**
- 6. No energy loss**
- 7. Thickness design** (t_0 by integer)
 $1t_0$ ----- $3.5 \mu\text{m TiN}$ / $1.6 \mu\text{m Ti layer}$

1

Theoretical Background & Simplifications

Coating A

Time the wave travel through each layer

Coating A

Interface: 1 2 3 4 5 6

Simplifications:

8. Base metal thickness: infinite

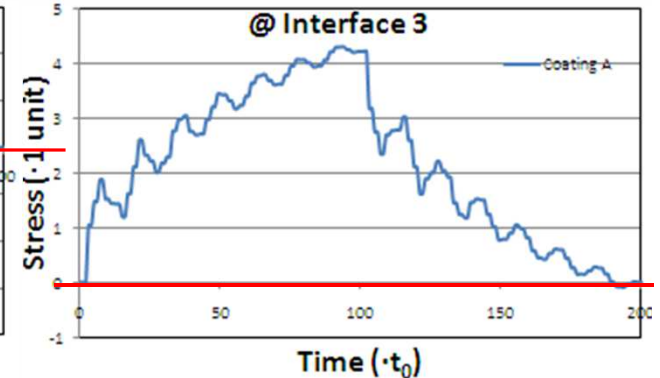

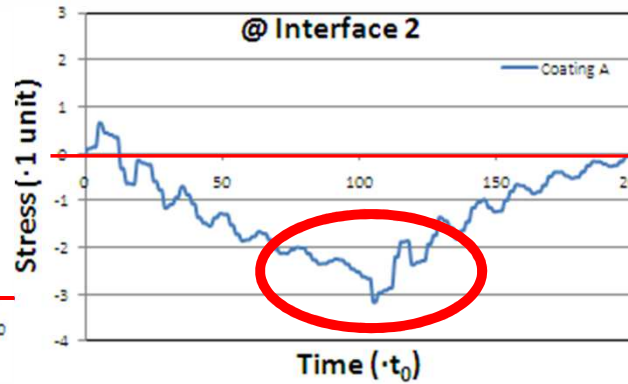

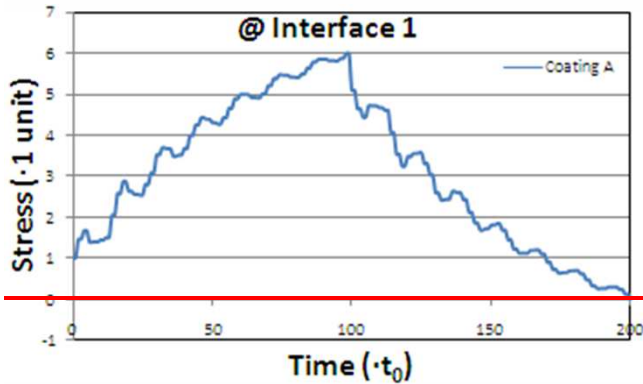

2 **Calculated Results**

2

Calculated Results

Coating A: Incident Compress. \rightarrow tensile @ 2, 4 interface

Potential fatigue crack initiation site

Interface: 1 2 3 4 5 6

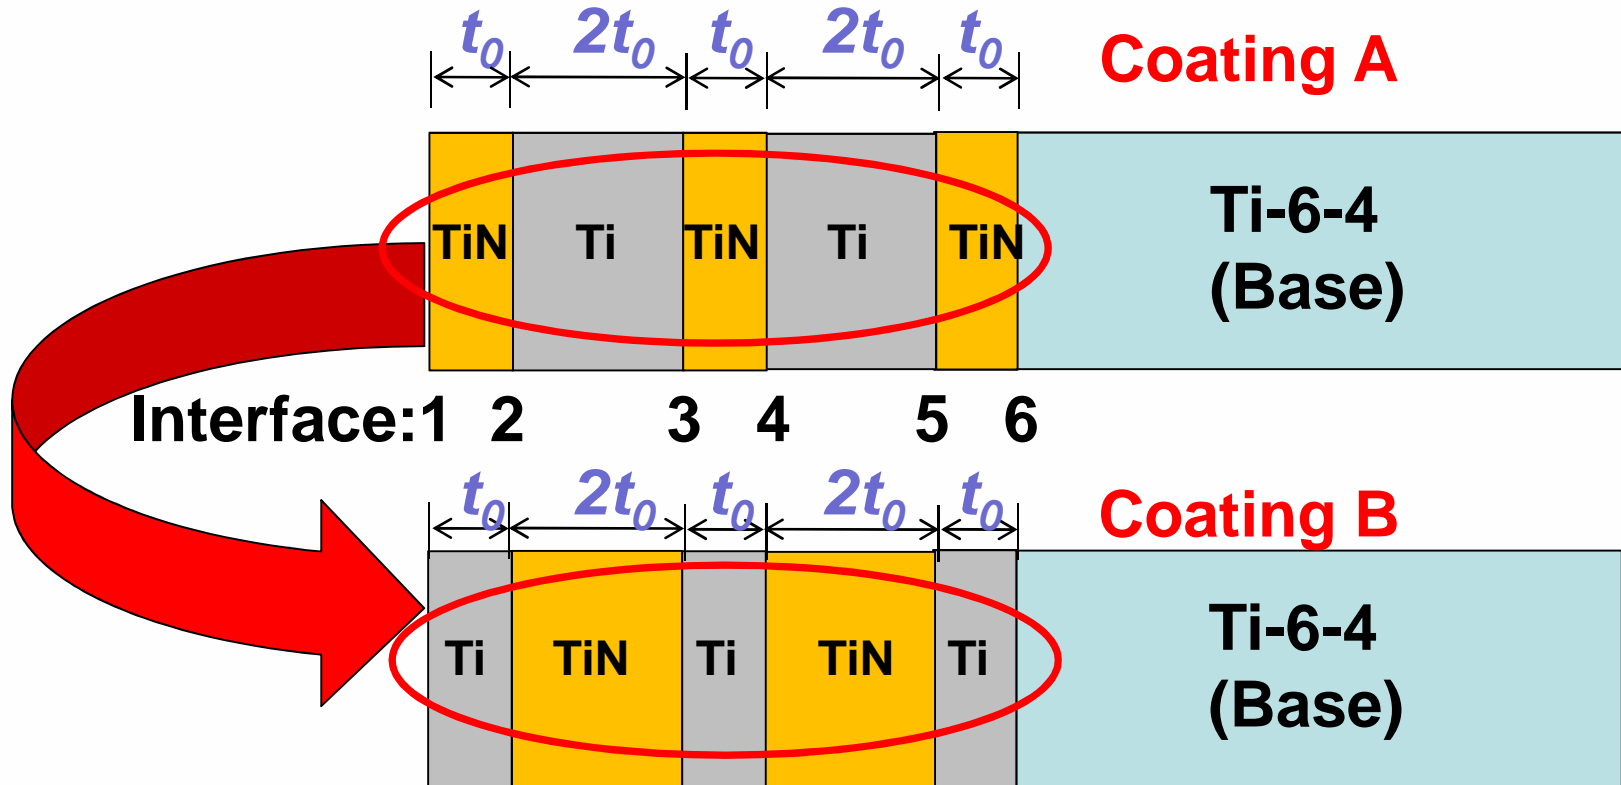

2

Calculated Results

Coating A Vs. Coating B

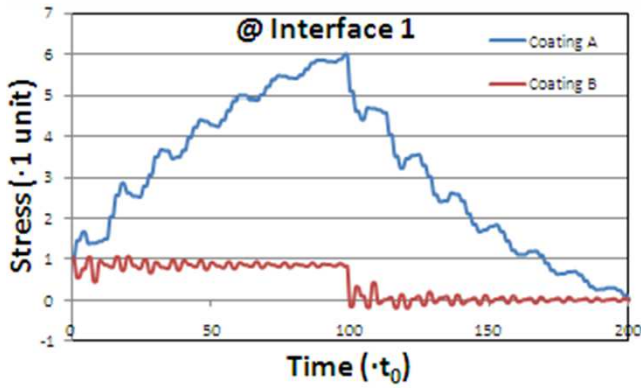

Time the wave travel through each layer

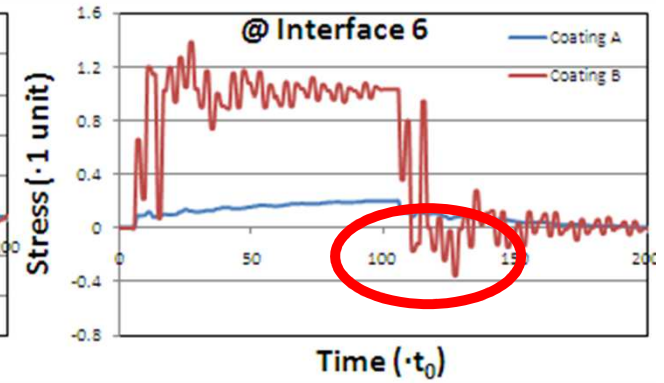

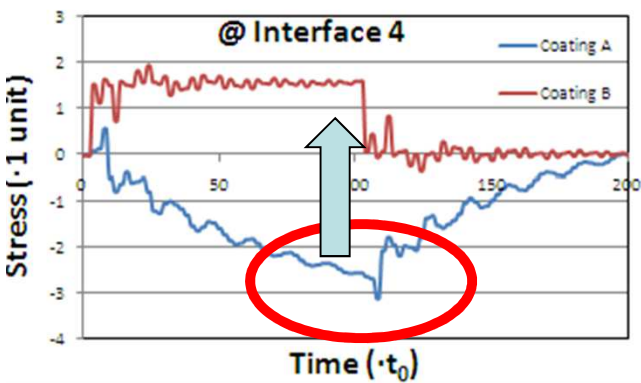

2

Calculated Results

Coating A Vs. Coating B

Better stress distribution
But **weak surface**

2

Calculated Results

Coating A Vs. Coating C

Time the wave travel through each layer

Coating A

Interface: 1 2 3 4 5 6

Coating B

Coating C

2

Calculated Results

Coating A Vs. Coating C

Coating C → No tensile stress @ any interfaces

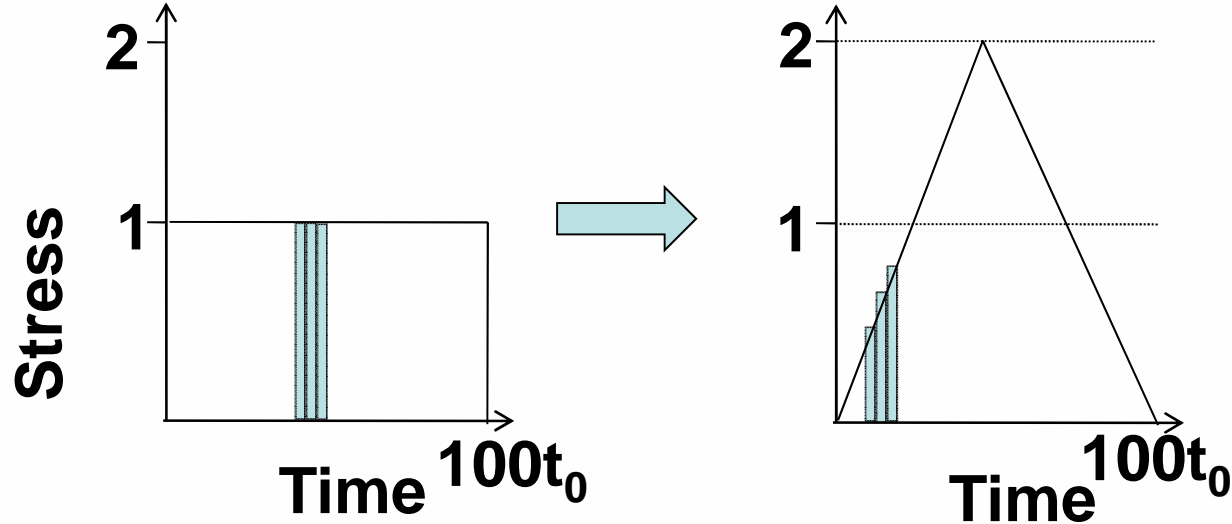

Best stress distribution & hard surface

2

Calculated Results

From Rectangle to Triangle Wave

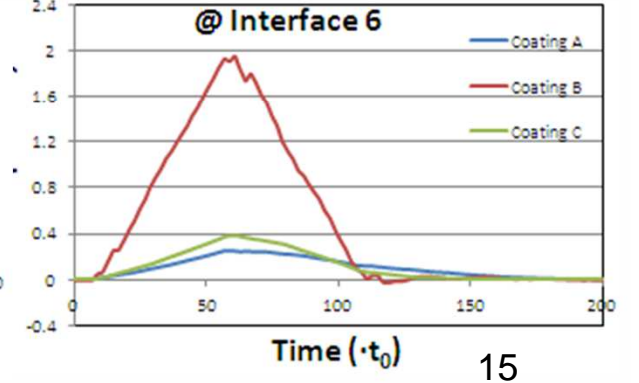

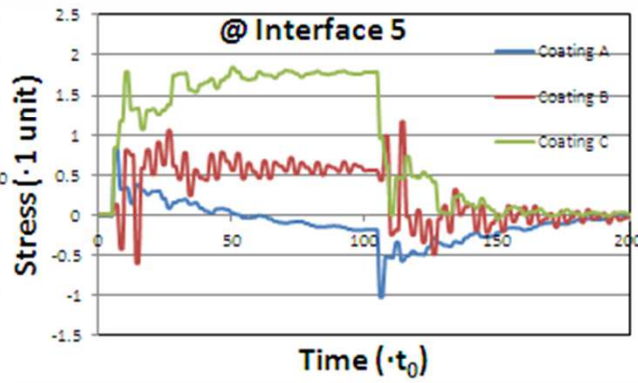

2

Calculated Results

2

Calculated Results

3 Conclusions

1. For the coating A, the stress at all the interfaces behaves either as maximum compressive stress or maximum tensile stress. Through changing the thickness combination and/or changing the stacking sequence of layers, the stress at all the interfaces behaves can be changed to moderate compressive stress, which indicates an optimized stress distribution.
2. Potentially, the present work will be of help to better understand the droplet impingement on multilayer coatings, and give guidance in the design of multilayer coatings.

3. Limitation

Assumption:

- * The impact occurs in one point.
- * Single droplet.
- * Same impact point.

Reality:

- * Round area.
- * Different droplets.
- * Different time.
- * Different places.

4. Future Work

Improvement of the current model, by taking into consideration:

- * Diameter of the droplet.
- * The time domain.

Thank You !
